RSA® Identity Governance and Lifecycle

Secure and compliant access

**Transforming identity with access assurance**

Organizations are rapidly transforming their digital operations in order to be competitive in the market.

This modernization has far-reaching impacts through the organization from rapid SaaS applications and cloud infrastructure adoption to IoT and business processes automation as well as enabling more third parties to easily access and share business information.

This digital transformation is creating more opportunity for organizations but also increases the threat landscape, making organizations more vulnerable to malicious activity. To compound the challenge for security, risk and IT teams, the growing number of mandates to comply with are causing many teams to become overwhelmed.

Identity management leaders find themselves struggling to gain assurance of who has access to what, identify and prioritize identity risks as they arise, and keep up with compliance to the myriad policies and regulations. Resource constraints and reliance on manual processes mean it’s nearly impossible to proactively manage the growing identity risks. Modern enterprises need actionable insights to ensure they are focusing on addressing the access risks that matter most.

**RSA® Identity Governance and Lifecycle: Secure and complaint access**

RSA Identity Governance and Lifecycle transforms secure access for enterprises as they are increasing their digital operations and helps ensure compliance with regulatory and corporate mandates. To address the challenges, RSA provides full access visibility and advanced analytics across all applications to detect identity risks and compliance issues that are lurking in your environment and help prioritize actions for organizations to respond.

**In-depth access visibility**

RSA provides in-depth access visibility at a granular level for every application, every user and every entitlement. This allows access assurance into who has access to what, and what they can do with that access. As IoT and business process automation
increase in today’s enterprise, understanding who is accessing those devices and processes as well as what level of access the machines have to connect to other devices and applications is critical to protecting this growing digital infrastructure.

Advanced risk-based analytics
Data is only as good as what you can do with it. Advanced analytics allows identity teams to be more effective and efficient by ingesting access and entitlement data combined with business context to identify access anomalies and policy violations. This means that identity teams as well as business users conducting access reviews have actions prioritized for them to address the most important access issues first to reduce risk.

Scale and performance
The amount of access and entitlement data that must be managed is continuing to grow as governance extends to more users and more applications and requires more granular-level detail into what users have access to. Tools must be built to manage massive amounts of data quickly and efficiently so as to not slow down the speed of business. RSA has one of the most scalable platforms for IGA. Our platform manages enterprises of all sizes with ease, including some of the largest global financial services firms that govern access to hundreds of thousands of identities including millions of entitlements.

Easy, business friendly and cost-effective
Let’s face it, IGA can be difficult, time-consuming and historically expensive to manage due to large amounts of custom development needed to collect and configure access details to target resources, legacy systems and diverse IT environments. However, with RSA, we reduce the complexity for identity teams through simple plug-and-play connections and configuration-based policies, workflows and processes so organizations don’t need to undertake costly, time-consuming and ongoing maintenance of customized coding to work for their environment. Just as important however, the RSA platform is optimized to be business-friendly simplifying access requests and reviews to reduce the identity burden on business users.

Deliver ROI
Historically, IGA could be a difficult program to quantify ROI and business impact. Enterprises today need to be able to show business impact for investments. RSA Identity Governance and Lifecycle dashboards and reporting make it easy to highlight key business impacts and demonstrate clear return on investment from time and cost savings as well as risk reduction to the organization.

RSA Identity Governance and Lifecycle
RSA helps you gain assurance that your access is secure and compliant. Our governance-first approach to identity management means you can gain the visibility you need to understand identity risks to your organization and establish policies and processes to ensure continuous compliance, while reducing the effort required by business users.
Integrating identity as a security and risk control

Identity is no longer just a siloed IT control. It represents a critical security component for managing digital risk. RSA is connecting the dots between its solutions, to eliminate identity-related blind spots, enabling you to respond more quickly to identity-based threats and in an orchestrated and automated way.

RSA Identity Governance and Lifecycle helps mitigate business and security risk across the RSA portfolio.

Connected with RSA Archer® Suite, risk teams can leverage application and identity risk to make employee and third-party access decisions based on risk.

Utilized with RSA NetWitness® Platform, security operations center (SOC) teams can gain more insight into incident investigations and remediation activities by providing a
holistic view of access and entitlement in the case of identity-based attacks.

Combined with RSA SecurID® Access can provide holistic identity management from access request and authorization to risk-based authentication to ensure only appropriate users gain access to resources and data.

Summary:
Today’s enterprises face unprecedented threats as they are increasing their digital operations. Security, risk and IT teams must find new ways to ensure they are securing access and ensuring compliance while supporting the speed of business. RSA provides a modern approach to identity governance that provides unsurpassed visibility combined with advanced risk-based analytics to prioritize actions and share identity insights across the security and risk ecosystem.

About RSA
RSA offers business-driven security solutions that provide organizations with a unified approach to managing digital risk that hinges on integrated visibility, automated insights and coordinated actions. RSA solutions are designed to effectively detect and respond to advanced attacks; manage user access control; and reduce business risk, fraud and cybercrime. RSA protects millions of users around the world and helps more than 90 percent of the Fortune 500 companies thrive and continuously adapt to transformational change.
